**Problem Set 10**

1. Let  $\{X_n\}$  be a sequence of random variables with  $P(X_n = n) = 1 - \frac{1}{n}$  and  $P(X_n = 0) = \frac{1}{n}$ . Does  $X_n$  converge to some random variable  $X$  in distribution? [Note: This example shows that even if a sequence of distribution functions converges, it may not converge to a distribution function.]
2. Let  $X_n \rightarrow X$  in  $r$ th mean, for some  $r > 0$ . Show that  $X_n \rightarrow X$  in probability.
3. Let  $X_n$  be a sequence of discrete random variables such that  $P(X_n = \frac{k}{2^n}) = \frac{1}{2^n}$  for  $k = 1, 2, \dots, 2^n$ . Show that  $X_n \rightarrow X$  in distribution, where  $X \sim U(0, 1)$ .
4. Let  $\{X_n\}$  be a sequence of *i.i.d.* random variables with finite variance  $\sigma^2$ . Let  $S_n^2 = \frac{1}{n-1} \sum_{i=1}^n (X_i - \bar{X})^2$ . Show that  $\{S_n^2\}$  converges to  $\sigma^2$  almost surely.
5. Let  $\{X_n\}$  be a sequence of identically distributed random variables with mean  $\mu \in \mathbb{R}$  and variance  $\sigma^2 < \infty$ , where  $\sigma > 0$ . Also assume that  $\text{Cov}(X_i, X_j) = 0$  for  $i \neq j$ . Show that  $\bar{X}_n \rightarrow \mu$  in probability.
6. Let  $\{X_n\}$  be a sequence of *i.i.d.* random variables with mean  $\mu$  and finite variance  $\sigma^2$ . Show that  $\sqrt{n} \frac{\bar{X}_n - \mu}{S_n} \rightarrow Z$  in distribution, where  $Z \sim N(0, 1)$ .
7. Let  $X_i$  and  $Y_i$ ,  $i = 1, 2, \dots$  are independently and identically distributed  $U(0, 1)$  random variables. Let  $N_n = \#\{k : 1 \leq k \leq n, X_k^2 + Y_k^2 \leq 1\}$ . Show that  $\frac{4N_n}{n}$  converges to  $\pi$  with probability one.
8. Show that

$$\lim_{n \rightarrow \infty} e^{-n} \sum_{k=0}^n \frac{n^k}{k!} = \frac{1}{2}.$$
